

Executive Dash (EDash)

Leverage your knowledge of Excel and VISUAL to get answers

The Business Issue

You know the data you need is in the VISUAL database. To get what you need, you could write a report. That may be fine, but what if you want to graph your data? At this point, most people turn to Excel; which means dumping the unformatted data into Excel, cleaning it up, formatting it and creating a graph. Pretty time consuming. Oh no, now someone wants to filter the data on the fly, and they want to drill down into the data...

The Solution

Edash is a traditional reporting tool, with one exception: The presentation layer is Excel, hence all the rich graphing, and analytical tools in Excel are available to you. Develop as many drill downs as you need to the supporting data; and with Visual South's exclusive VISUAL Launch for EDash, you can drill into the actual VISUAL transaction screen.

Share the knowledge with people inside or outside your organization with the built in Distribution Manager.

EDash not only works with VISUAL, it works with any ODBC supported database.

The Result

Since you already know VISUAL and Excel, EDash allows you to leverage that knowledge to get the information you need. Dashboards are now a reality. The burden on IT is reduced because due to the users ability to filter on the fly and drill down, one report can serve many purposes.

Works with all versions of VISUAL and Excel 2003 and 2007; not compatible with SQLBase or Oracle.
