

Simplified Job Tracking

Focus on where the jobs are

The Business Issue

Capturing actual labor time on the shop floor with a barcode scanner can provide crucial data for production. Unfortunately, this data is also dependent on how accurately the shop worker reports it. The more steps required capturing information, the more likely the chances are of making mistakes.

The Solution

Visual South's Simplified Job Tracking (SJT). SJT was developed to allow a company to track a work order's progress through the shop floor with just one scan by the operator. No longer does the operator have to spend more than a few seconds at the barcode station to report the work completed. Simply scan their id (or default the id for each station), and scan the work order traveler operation barcode. SJT also gives the ability to issue materials and receive the completed work order to inventory, all with that same single scan.

The Result

Simplified processes for capturing shop floor data results in more accurate information. Accurate information reported against a work order results in better management of shop floor processes. Better management of shop floor processes results in improved scheduling and inventory accuracy. Improved scheduling and inventory accuracy results in more throughput. More throughput results in greater ROI for your Simplified Job Tracking implementation.

Simplified Job Tracking. You can't argue with the results!

Works with VISUAL versions 6.5.2 and above; not compatible with SQLBase or Oracle.
